Fleet Management, Security & Communications

CargoGuard - Never leave your shipment unattended!

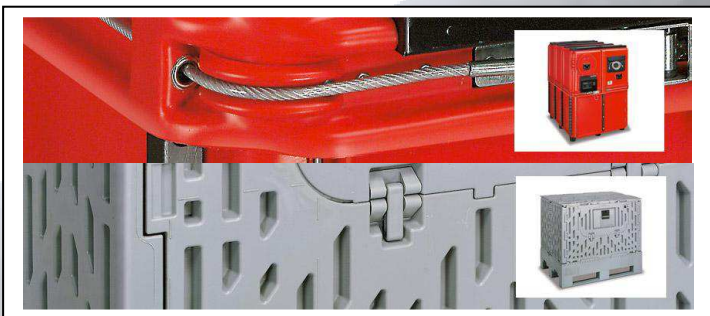

The CargoGuard system from Satcom is a unique and advanced technical solution to protect valuable goods, high-end products or confidential and classified documents against the risks of loss, theft, spying and manipulation during transportation and storage. CargoGuard enables logistic companies, manufacturers, authorities and governments to safeguard the handling of valuable goods or sensitive documents from person-to-person across all gaps of an intermodal supply chain.

CargoGuard unites a locking and sealing function, GPS tracking and a monitoring system within one integrated technical solution. For the first time one single security system locks, guards and monitors any transports around the world, around the clock and across any break of a supply chain.

The CargoGuard product portfolio – by land, sea and air.

The SmartLock is the core piece of the CargoGuard system and represents - together with the security server - the basis of our portfolio. The SmartLock is an intelligent locking and monitoring unit which can be integrated in virtually every closable transport container. The SmartLock locks the container and seals it using the CargoGuard vSeal technology and monitors the thus secured shipment. The SmartLock is available in two different versions, which are tailored to different security needs. While CG secure is the basis locking system, CG track additionally offers GPS tracking, GPRS communication and a real time alarm system.
